## OpenCL Events

An event is an object that communicates the status of OpenCL commands

Oregon State University  
Computer Graphics

mjb -- February 19, 2015

## From the OpenCL Notes: 11. Enqueue the Kernel Object for Execution

```
size_t globalWorkSize[ 3 ] = { NUM_ELEMENT, 1, 1 };  
size_t localWorkSize[ 3 ] = { LOCAL_SIZE, 1, 1 };  
  
status = clEnqueueNDRangeKernel( cmdQueue, kernel, 1, NULL, globalWorkSize, localWorkSize, 0, NULL, NULL );
```

```
status = clEnqueueNDRangeKernel( cmdQueue, kernel, 1, NULL, globalWorkSize, localWorkSize, 0, NULL, NULL );
```

The diagram shows three labels: '# events', 'event object', and 'event wait list'. Arrows point from '# events' and 'event object' to the 'event wait list' label, which is positioned below the 'status = clEnqueueNDRangeKernel' line of code.

## Creating an Event

```
cl_event waitKernelC;  
  
status = clEnqueueNDRangeKernel( cmdQueue, kernel, 1, NULL, globalWorkSize, localWorkSize, 0, NULL, &waitKernelC );
```

The diagram shows two labels: 'event being created' and 'event(s) to wait for'. An arrow points from 'event being created' to the '&waitKernelC' argument in the code. A bracket is placed under the '&waitKernelC' argument, with an arrow pointing from 'event(s) to wait for' to the bracket.

## Waiting for Events

```
cl_event waitKernelA, waitKernel B.  
  
...  
  
cl_event dependencies[ 2 ];  
dependencies[ 0 ] = waitKernelA;  
dependencies[ 1 ] = waitKernelB;  
  
status = clEnqueueNDRangeKernel( cmdQueue, kernelC, 1, NULL, globalWorkSize, localWorkSize, 2, dependencies, NULL );
```

event being  
created

event(s) to wait for

Computer Graphics

mjb -- February 19, 2015

## Waiting for One Event

```
cl_event waitKernelA, waitKernel B.  
  
...  
  
status = clEnqueueNDRangeKernel( cmdQueue, kernelC, 1, NULL, globalWorkSize, localWorkSize, 1, &waitKernelA, NULL );
```

## Placing a Barrier in the Command Queue

```
status = clEnqueueBarrier( cmdQueue );
```

This does not complete until all commands enqueued before it have completed.

Oregon State University  
Computer Graphics

mjb -- February 19, 2015

## Placing an Event Marker in the Command Queue

```
cl_event waitMarker;  
status = clEnqueueMarker( cmdQueue, &waitMarker );
```

This does not complete until all commands enqueued before it have completed.

**This is just like a barrier, but it can throw an event to be waited for.**

Oregon State University  
Computer Graphics

mjb -- February 19, 2015

## Waiting for Events Without Enqueuing Another Command

```
status = clEnqueueWaitForEvents( cmdQueue, 2, dependencies );
```

This **blocks** until the specified events are thrown, so use it carefully!

Oregon State University  
Computer Graphics

mjb -- February 19, 2015

## I Like Doing This

```
// wait until all queued tasks have taken place:

void
Wait( cl_command_queue queue )
{
    cl_event wait;
    cl_int status;

    status = clEnqueueMarker( queue, &wait );
    if( status != CL_SUCCESS )
        fprintf( stderr, "Wait: clEnqueueMarker failed\n" );

    status = clEnqueueWaitForEvents( queue, 1, &wait );
    if( status != CL_SUCCESS )
        fprintf( stderr, "Wait: clEnqueueWaitForEvents failed\n" );
    else
        fprintf( stderr, "Wait: clEnqueueWaitForEvents returned\n" );
}
```

Call this before starting the timer, before ending the timer, and before using data from an array returned from OpenCL.

## Getting Event Statuses: Remember This?

```
cl_uint numPlatforms;  
status = clGetPlatformIDs( 0, NULL, &numPlatforms );  
  
fprintf( stderr, "Number of Platforms = %d\n", numPlatforms );  
  
cl_platform_id * platforms = new cl_platform_id[ numPlatforms ];  
status = clGetPlatformIDs( numPlatforms, platforms, NULL );
```

This way of querying information is a recurring OpenCL pattern

	How many to get	Where to put them	How many total there are
status = clGetPlatformIDs(	0,	NULL,	&numPlatforms );
status = clGetPlatformIDs(	numPlatforms,	platforms,	NULL );

Oregon State University  
Computer Graphics

mjb -- February 19, 2015

## Getting Event Statuses

```
cl_int eventStatus;  
status = clGetEventInfo( waitKernelC, CL_EVENT_COMMAND_EXECUTION_STATUS, 1*sizeof(cl_int),  
&eventStatus, NULL );
```

CL\_QUEUED  
CL\_SUBMITTED  
CL\_RUNNING  
CL\_COMPLETE

Note that this is a nice way to check on event statuses without blocking. Thus, you could put this in a loop and go get some other work done in between calls..
