

The Book

*Start Reading
Chapter 5 Now*

Chapter 5: Link layer

our goals:

- ❖ understand principles behind link layer services:
 - error detection, correction
 - sharing a broadcast channel: multiple access to it
 - link layer addressing
 - local area networks: Ethernet, VLANs
- ❖ instantiation, implementation of various link layer technologies

Link layer, LANs: outline

5.1 introduction, services

5.2 error detection,
correction

5.3 multiple access
protocols

5.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

5.5 link virtualization:
MPLS

5.6 data center
networking

5.7 a day in the life of a
web request

Link layer: introduction

terminology:

- ❖ hosts and routers: **nodes**
- ❖ communication channels that connect adjacent nodes along communication path: **links**
 - wired links
 - wireless links
 - LANs
- ❖ layer-2 packet: **frame**, encapsulates datagram

data-link layer has responsibility of transferring datagram from one node to *physically adjacent* node over a link

Link layer: context

- ❖ no more planning of routes at this layer!
- ❖ datagram transferred by different link protocols over different links:
 - e.g., Ethernet on first link, frame relay on intermediate links, 802.11 on last link
- ❖ each link protocol provides different services
 - e.g., may or may not provide reliable data transfer over link

transportation analogy:

- ❖ trip from Corvallis to Washington State Convention Center (WSCC):
 - car: Corvallis to Seattle Westin.
 - walk: Seattle Westin to monorail station.
 - train: monorail station to WSCC.
- ❖ tourist = **datagram**
- ❖ transport segment = **communication link**
- ❖ transportation mode = **link layer protocol**
- ❖ travel agent = **routing algorithm (at different layer)**

Link layer services

❖ *framing, link access:*

- encapsulate datagram into frame, adding header, trailer
- channel access if shared medium
- Media Access Control (MAC) addresses used in frame headers to identify source and destination
 - different from IP address!

❖ *reliable delivery between adjacent nodes*

- we learned how to do this already (chapter 3)!
- seldom used on low bit-error link (fiber, some twisted pair)
- wireless links: high error rates
 - *Q*: why both link-level and end-end reliability?

Link layer services (more)

❖ *flow control:*

- pacing between adjacent sending and receiving nodes

❖ *error detection:*

- errors caused by signal attenuation, noise.
- receiver detects presence of errors:
 - signals sender for retransmission or drops frame

❖ *error correction:*

- receiver identifies *and corrects* bit error(s) without resorting to retransmission

❖ *half-duplex and full-duplex*

- with half duplex, nodes at both ends of link can transmit, but not at same time
- with full duplex, both can transmit at the same time

Where is the link layer implemented?

- ❖ in each and every host
- ❖ link layer implemented in “adaptor” (aka *network interface card* NIC) or on a chip
 - Ethernet card, 802.11 card; Ethernet chipset
 - implements link, physical layer
- ❖ attaches into host's system buses
- ❖ combination of hardware, software, firmware

Adaptors communicating

❖ sending side:

- encapsulates datagram in frame
- adds error checking bits, manages, reliable data transfer (rdt), flow control, etc.

❖ receiving side

- looks for errors, rdt, flow control, etc
- extracts datagram, passes to upper layer at receiving side

Link layer, LANs: outline

5.1 introduction, services

5.2 error detection,
correction

5.3 multiple access
protocols

5.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

5.5 link virtualization:
MPLS

5.6 data center
networking

5.7 a day in the life of a
web request

Error detection

EDC = Error Detection and Correction bits (redundancy)

D = Data protected by error checking, may include header fields

- Error detection not 100% reliable!
 - protocol may miss some errors, but rarely
 - larger EDC field yields better detection and correction

Parity checking theory

single bit parity:

- ❖ detects single bit errors.
- ❖ The parity bit is 1 if the number of 1s is odd.
- ❖ The parity bit is 0 if the number of 1s is even.

DATA	PARITY
10101	1
11110	0
01110	1

Change that 0 to a 1!

two-dimensional bit parity:

- ❖ detect and *correct* single bit errors
- ❖ requires grouping transmissions into blocks

				row parity →
	$d_{1,1}$...	$d_{1,j}$	$d_{1,j+1}$
	$d_{2,1}$...	$d_{2,j}$	$d_{2,j+1}$

	$d_{i,1}$...	$d_{i,j}$	$d_{i,j+1}$
column parity ↓	$d_{i+1,1}$...	$d_{i+1,j}$	$d_{i+1,j+1}$

1	0	1	0	1	1
1	1	1	1	0	0
0	1	1	1	0	1
1	0	1	0	1	0

no errors

1	0	1	0	1	1
1	1	1	1	0	0
0	1	1	1	0	1
1	0	1	0	1	0

parity
error

*correctable
single bit error*

Internet checksum (review)

goal: detect "errors" (e.g., flipped bits) in transmitted packet
(note: used at transport layer *only*)

sender:

- ❖ treat segment contents as sequence of 16-bit integers
- ❖ checksum: addition (1's complement sum) of segment contents
- ❖ sender puts checksum value into UDP checksum field

receiver:

- ❖ compute checksum of received segment
- ❖ check if computed checksum equals checksum field value:
 - NO - error detected
 - YES - no error detected.
But maybe errors nonetheless?

Cyclic redundancy check

- ❖ more powerful error-detection coding
- ❖ view d data bits as a binary number D
- ❖ choose bit pattern (called a “generator”) of $r+1$ bits as binary number G
- ❖ sender: choose r CRC bits as a binary number R such that entire binary number DR exactly divisible (using XOR) by G
- ❖ receiver divides DR by G (using XOR): If non-zero remainder: error detected!
 - can detect all burst errors less than $r+1$ bits
- ❖ widely used in practice (Ethernet, 802.11 WiFi, ATM)

CRC example

- ❖ Sender wants to calculate DR

CRC example

- ❖ **1)** Bit shift left
(i.e. multiply by 2)
by size of $G - 1$
- ❖ **101110**
turns into...

CRC example

- ❖ 1) Bit shift left
(i.e. multiply by 2)
by size of $G - 1$
- ❖ 101110
turns into
101110 000

CRC example

- ❖ 2) Divide by G
- ❖ How many times does 1001 go into 1011?

CRC example

- ❖ How many times does 1001 go into 1011?
- ❖ Once!

CRC example

- ❖ Multiply 1 times 1001
to get 1001

CRC example

- ❖ XOR 1011 and 1001 to get 10
 - 1011
 - 1001
 - 0010

CRC example

- ❖ Carry down the 1

CRC example

- ❖ How many times does **1001** go into **101**?

CRC example

- ❖ How many times does **1001** go into **101**?
- ❖ **Zero times!**

CRC example

- ❖ Multiply 0 times 100 to get 000

CRC example

❖ XOR 101 and 000 to get 101

- 101
000
101

CRC example

- ❖ Carry down the 0

CRC example

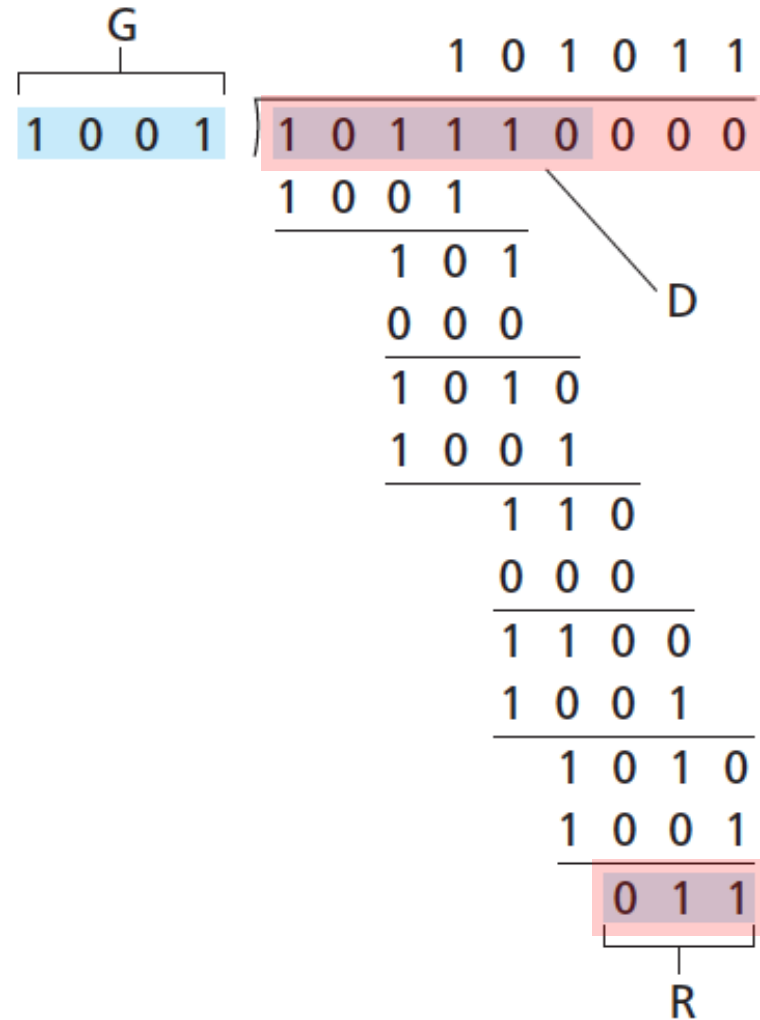

❖ Repeat.....

CRC example

❖ 3) Replace bit shifted part with remainder

❖
$$\begin{array}{r} 101110000 \\ \underline{011} + \end{array}$$

CRC example

❖ 3) Replace bit shifted part with remainder

$$\begin{array}{r}
 101110000 \\
 \quad \quad 011 + \\
 \hline
 101110011
 \end{array}$$

❖ Sender sends
101110011

CRC example

- ❖ Receiver wants to error check
 - 1) Divide received frame by G (*using XOR*)
 - 2) If remainder is 0, no errors!
If non-0, errors!

Link layer, LANs: outline

5.1 introduction, services

5.2 error detection,
correction

5.3 multiple access
protocols

5.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

5.5 link virtualization:
MPLS

5.6 data center
networking

5.7 a day in the life of a
web request
